## About Us

Trinity Future-In is a limited liability company, based in Bangalore India. It has been set up by three smart inventors and a seasoned professional, who has had a successful entrepreneurial past. Two of the inventors have graduated in MEMS [Micro Electro Mechanical systems]. With the help of a professional team of advisers, the company has achieved several breakthroughs, developing a new technology, and presently has 12 patent applications to its credit.

Trinity Future-In is a technology company and at present focused in the Digital Security Arena. There is a team of 18 dedicated professionals and security experts wholly committed to the present focus of the company.

"Let no one  
misuse your digital IP"

## Technology:

The core of Trinity's new technology is in the digital asset security space, which blocks intrusion and all forms of piracy, unauthorised duplication and counterfeiting. In layman's terms the technology works within the files structures [unlike the lock and key approach- i.e. Protection from the outside], making files invisible or inactive. Most files become invisible. Those which must be seen and used, while visible, will be inactive against any unauthorized instruction. Besides several layers of software protection, firmware gateways [based on MEMS] have also been used.

## Testing/ Certification:

The technology has been tested and certified by CDAC and STQC. A letter of commendation from the President of India has also been received. The technology is now being profiled in magazines like Digital Learning and Animation Today.

## Products:

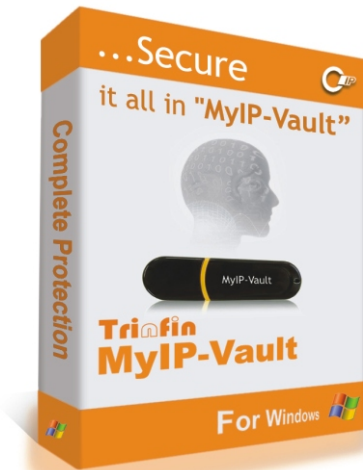

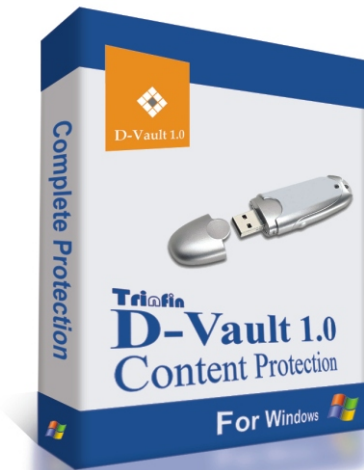

The first product, a unique USB type device called the Trinfin eS-Vault is ready for the market. The technology blocks counterfeiting of enterprise and entertainment [games] software which is stored within it. The second product, the Trinfin D-Vault does for data the same as the eS-Vault does for software.

Two further products have also been developed and are under testing -- The Trinfin Control Vault and the Trinfin MyIP Vault -- the first a B2B product and the latter a B2C product. It is a simplified way, possibly through franchisees or retail branches, whereby the individual user can get his contents, IPR or any digital data completely protected and made secure against unauthorized copying. The "drag and drop" procedure simplifies the entire process.

## Solutions:

"Digital Security", is a pain point for most organizations. Trinity has a wide expertise of handling different security needs.

With the expertise it holds, Trinity could convert any digital security need into a solution within a short span of time and using a Qualitative approach.

## The Safe & Secure

distribution media to stop digital

## COUNTERFEITING

### Products in the Pipeline:

Products soon to be completed are products for anti-piracy of music, films & videos, personal data, asset management compliance controls; online storage and safe distribution of content and software etc. The Trinfin Serve-Vault is also under development and the product can be completed in a short time. It enables the storage, transfer and sale of software or content online in a secure manner.

### Other Applications:

There are innumerable applications for this technology. One, for example, is the E Passport. To elaborate, all work around the world, with regard to E Passports involves Biometrics and RFID authentication of the user, which does not protect the contents in the passport, but only authenticates the user. Our technology is compatible with Biometrics and RFID and especially protects the contents. It not only blocks unauthorised entry, editing or tampering, but can also create a log of any such tampering.

### Conclusion:

The company aims to become a “Powerhouse” in Digital security and the experts could be called in to address any Digital Security need.
